

Narrowing the 221-gene search with external muscle programmes

COQ8A >=3 vs 1 UMI | TSS enrichment >=3 | 201 matched pairs | 4 libraries from 2 source lines

A: ratios and effective genes (g) / peaks (p); * nominal paired p<0.05. Grey cells: no qualifying peak set.
RNA links: COQ8A >=2 vs 1, TSS>=3, partial r>0, link q<0.05 and four evaluable libraries.
C: 221 starting genes -> 14 GO pro-differentiation genes -> 6 genes with 18 positive links -> 3 genes with 7 lower-MRF-score links.
SIN3A signature overlaps only one of the 221 genes; its results remain in the complete tables.
